Some people say that the digital revolution started in the 1980s. Others claim that it spread like wildfire only at the onset of the 21st century. For an average person, the revolution begins with the first PC, SMART Board, or personal iPhone. Whatever may be the case with you, these are exciting times indeed with over a billion users of Facebook alone already.

In 2001, I was invited to write on the ‘global digital divide’ for the International Monetary Fund’s Finance & Development magazine. I then calculated that nearly 400 million people were online at the turn of the century. Perhaps by this time next century, almost everyone will be online in some way, even those living in the deepest Amazon forest or remotest hamlets.

Hence, we are excited about this issue which sheds a new light on games and online experience. We are grateful to the experts who contributed to this issue or took the time to speak with us about their experiences and expertise and what they envision for the future.
